

Partially automated robotic manipulation assisted by a shared autonomy framework for collaborative analysis and input from multiple remote scientists through natural language input and 3D scene understanding for real-time, in-situ elemental analysis

Amy Phung, Gideon Billings, Andrea F. Daniele,
Matthew R. Walter, Richard Camilli

Ocean Exploration Methods

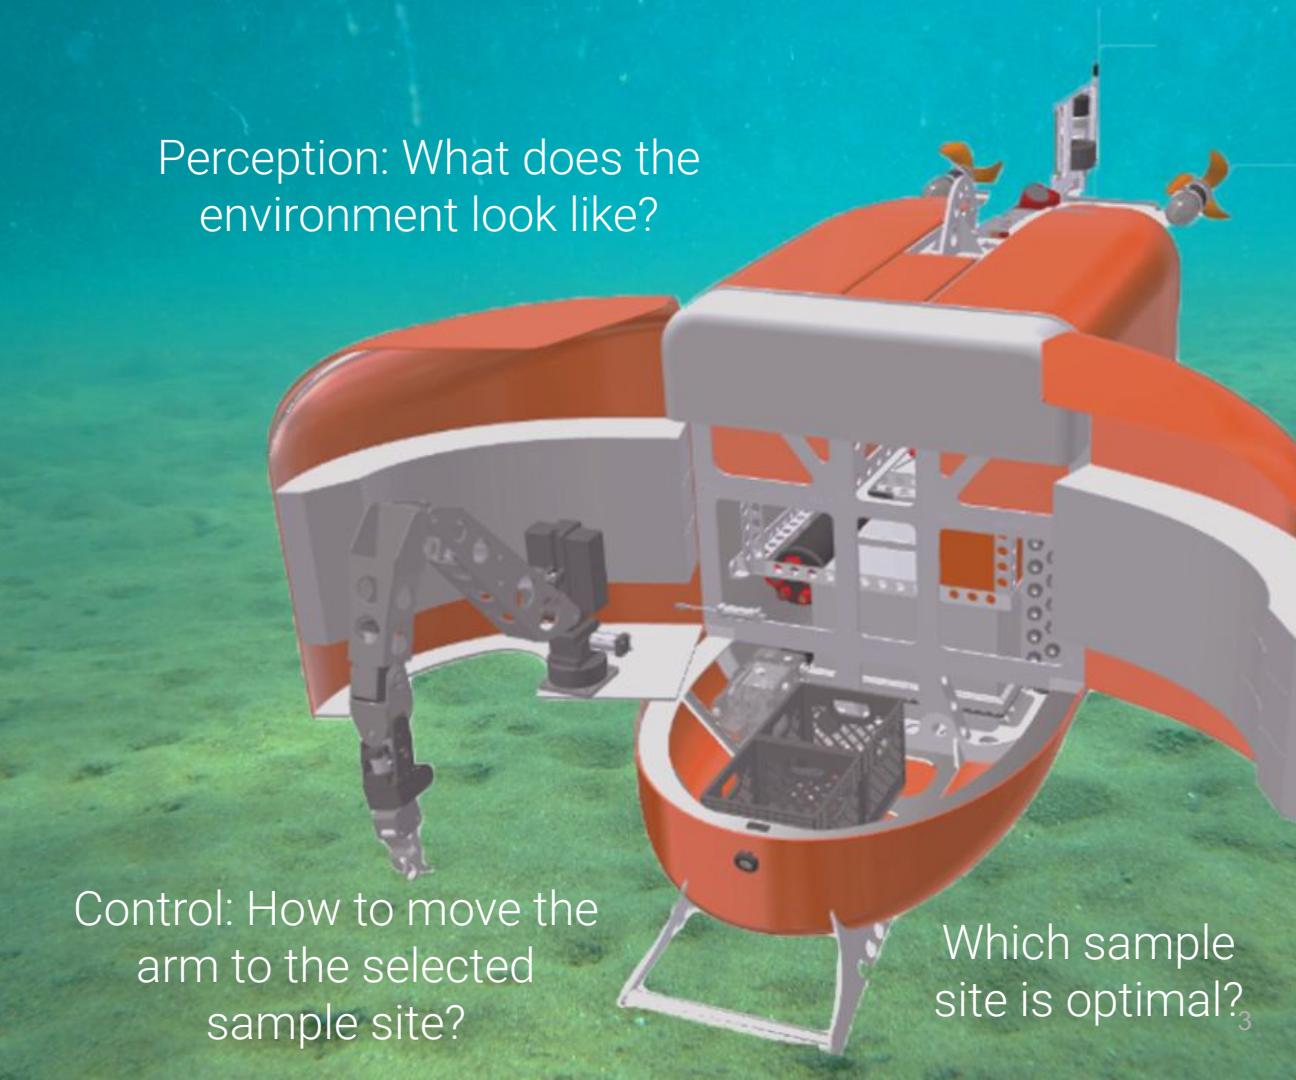

| Divers | ROVs | AUVs |
|--------------------------|--|---|
| + Dexterity | + Dexterity | + Autonomy = lower operation cost |
| + Low-Cost | + Long operation times | + Support for multiple remote operators |
| - Limited by depth | - Expensive - requires support vessel | + Long operation times |
| - Limited operation time | - Participation limited by space on ship | - Intervention remains a challenge |

Autonomous Manipulation Challenges

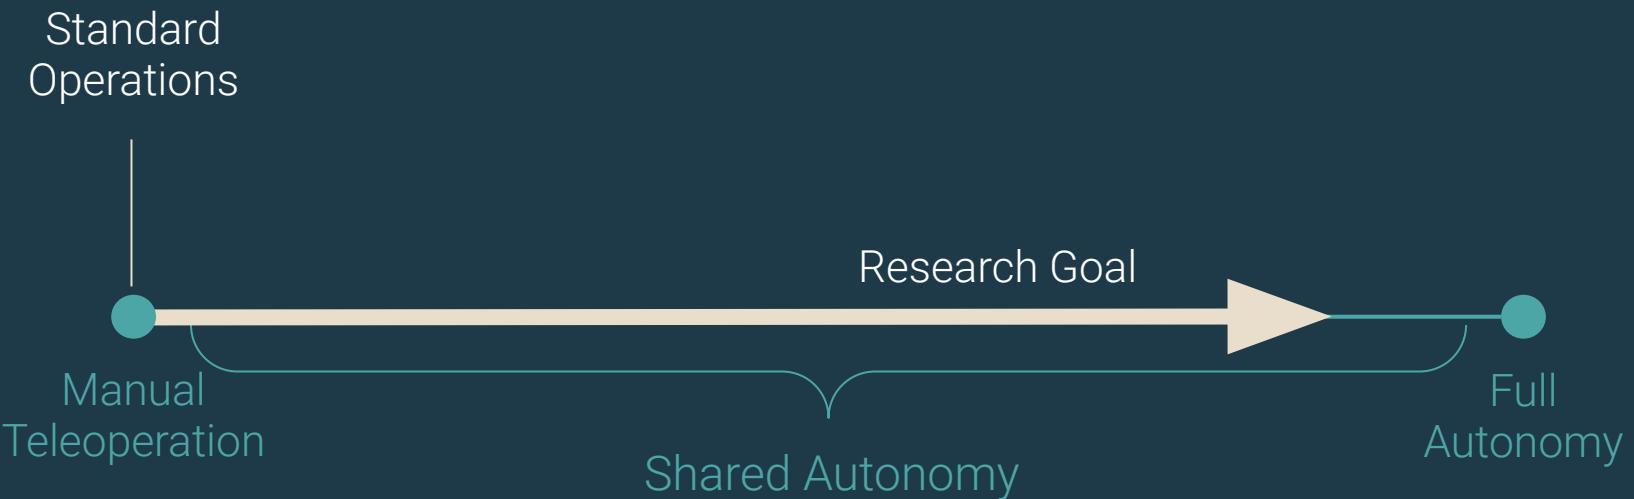

Perception: What does the environment look like?

Control: How to move the arm to the selected sample site?

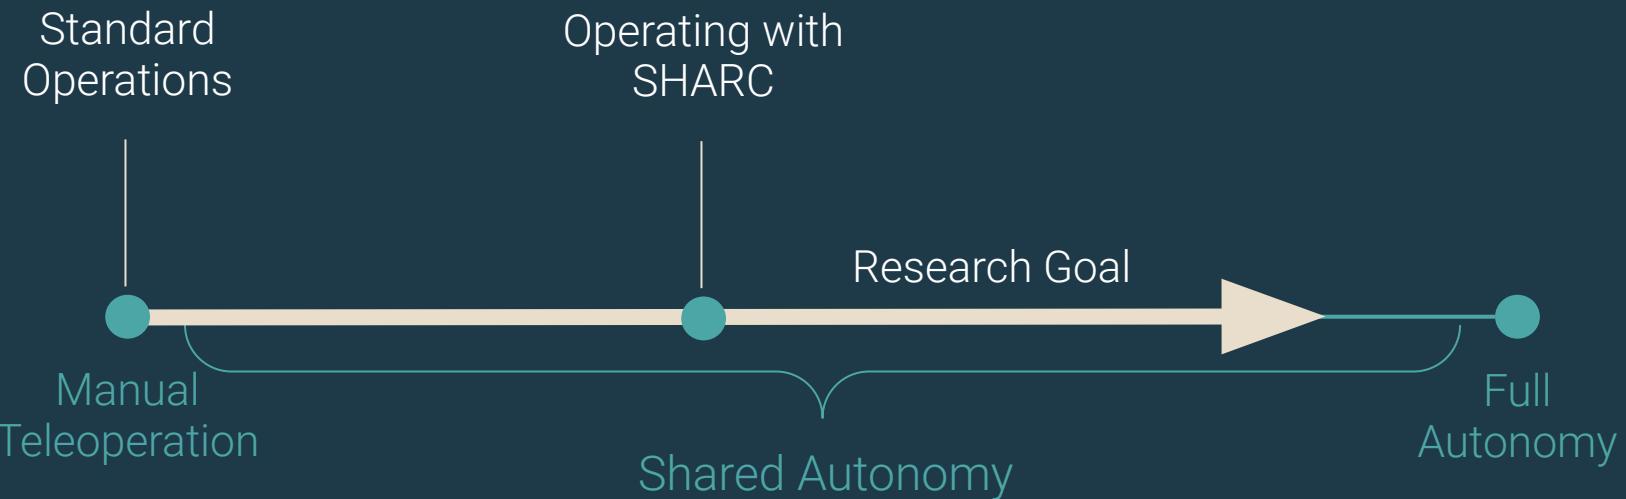

Which sample site is optimal?

Use Natural Language to pick up tool

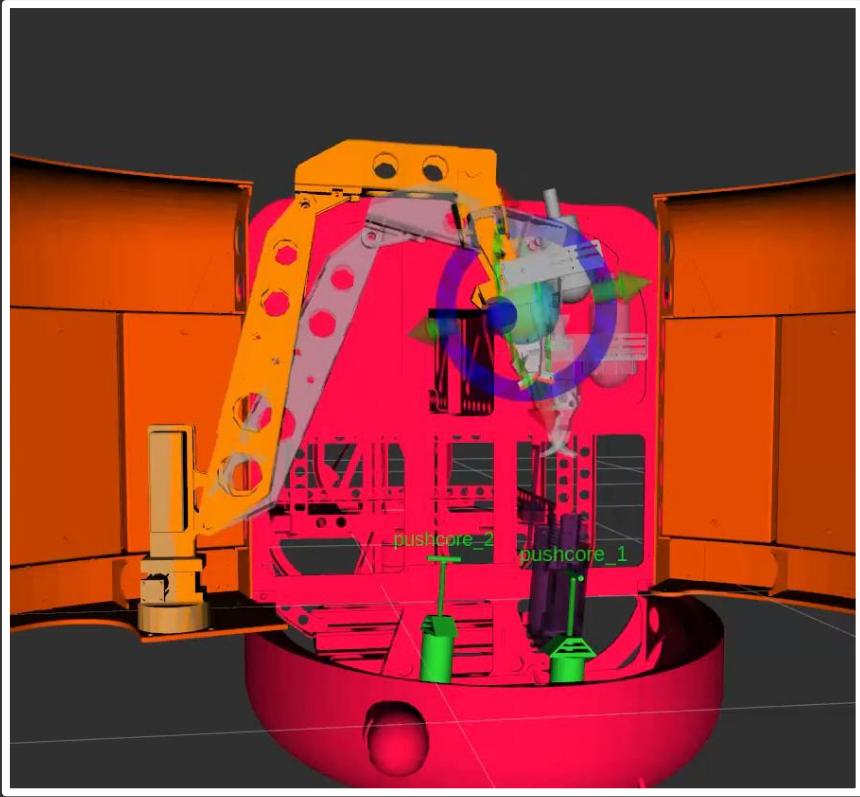

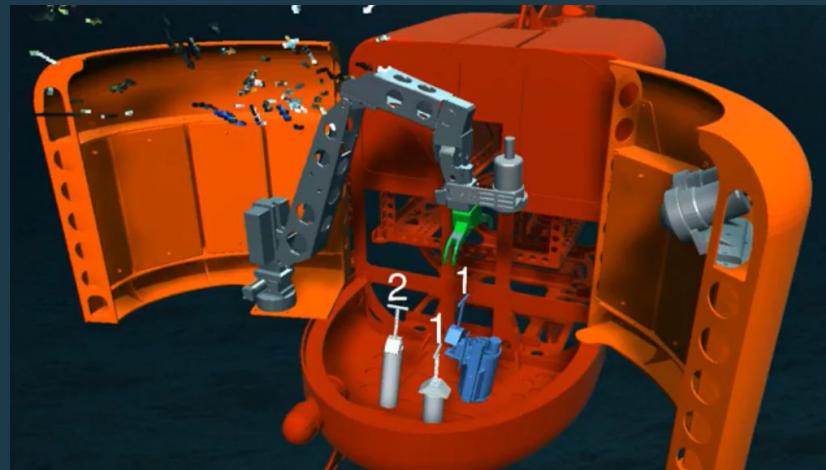

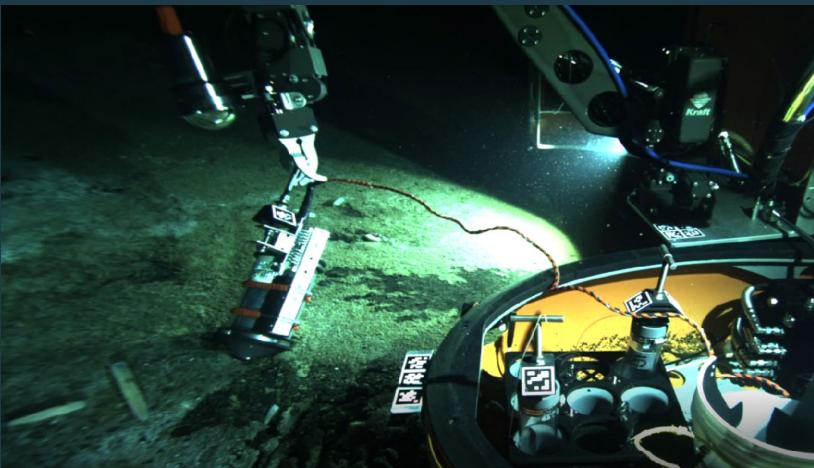

Scientist analyzes XRF Data

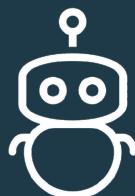

XRF Returned to Tool Tray

Discussion

- Site selection
- Data analysis & interpretation
- Varied expertise

- Tool detection
- Low-level control

Looking Forward

Thanks For Listening!
